

Corrosive Drywall Investigations

Since 1992, IET's staff provides expert testimony in diverse environmental fields to attorneys in legal cases, insurance professionals, construction firms, business professionals and residential homeowners. We have been involved with the Chinese/Corrosive drywall issue since 2007 testing and consulting on numerous projects and legal cases. Although the issues surrounding Corrosive drywall can be difficult to define, IET has established itself as a leader in the evaluation and consulting field by adhering to accepted State of Florida and Federal guidelines and through long standing relationships with excellent laboratories around the country.

Since not all Chinese drywall has corrosive characteristics associated with it, we can help to determine the specific material present in a building. Our investigations begin with an interview of the occupants followed by a thorough visual inspection including attics and HVAC systems. Depending on the desires of the client and the visual evidence found, minimally destructive bulk sampling can be conducted for further confirmation of the presence or absence of Corrosive drywall in accordance with State of Florida Case Definition guidelines.
