

Post Remediation Verification (PRV)

Anytime your home or office is affected by a moisture-related event, some type of cleanup will be required. For minor problems, simple clean-up is all that is needed; however, for major events extensive remediation efforts must be conducted prior to repairs to ensure that no continuing or long term building health issues remain. IET can conduct a Post Remediation Verification (PRV; aka clearance test) after remediation has been performed but before reconstruction begins. This allows IET to verify that all contaminated materials have been removed from the home and that remediation has been effective, returning indoor mold levels to acceptable parameters.

By analyzing the samples in our in-house lab, we can often provide a verbal clearance within hours of the evaluation without having to wait several days. Third party lab analysis is also available when necessary for legal and insurance purposes.

IET has been performing these services since 1992 with thousands of satisfied clients in the commercial, residential, health care and education field.

No matter what your issue or concern, most problems can be identified with proper testing and a thorough understanding of the building history and structure. Contact us today at 727-446-7717 so that we can answer further questions you may have!

SERVICES OFFERED	
Air quality testing	Allergen testing
Mold inspection and testing	Formaldehyde / VOC testing
Moisture mapping	EMF / RF testing
Building Science	IR thermal imaging
Chinese/Corrosive Drywall	Sick Building Syndrome
Expert Legal and Insurance support	Remediation protocol development
Document Review	Photo documentation
